

Recycling of Expanded Polystyrene is Our Past, Present, and Future

For 40 years, we have been working with our customers to make recycling an enduring reality.

Since then, our company, which started out as a distributor of chemical materials for Matsushita Electric Works, Ltd. (now Panasonic Corporation), noticed that vast quantities of expanded polystyrene (EPS) were being discarded at the Tsukiji Market. Therefore, we launched an EPS recycling business that has since gone through many vicissitudes to develop into a nationwide recycler that processes 30,000 tons of EPS a year and commands 80% of the market.

With our unique system of heating EPS until it melts and then shaping it into ingots, we have been called the class act for recycling in Japan, and we have even received accolades from overseas. We have thus named this plastic recycling system made in Japan "J-EPS Recycling," and we continue to support the recycling of plastic resources around the world.
